

During our interview, we demonstrated the following features:

- Hosted on Django
- User and Event creation in Database
- Display and edit users and events in webpage, pulled from database
- Filter events via a search form

In the future we will

- Allow users to sign up for events, probably using AJAX
- Allow users to follow their friends
- Expand search features to order by popular events
- Host on AWS or Azure (which involves migrating our sqlite database to postgres)
